

ARM SLING

ARM SLING WITH DORSAL STRAP

It is designed to prevent or to completely reduce the glenohumeral sub-luxation (source of pains) while allowing a daily setting up by the patients themselves, without changing the initial adjustment.

The elasticated strap exerts a vertical traction on the humerus by applying the force of the traction to the elbow and to the homolateral shoulder.

Available in 2 models (with or without a dorsal strap), they are used in case of fracture, tendonitis or sprain to promote healing of the upper limb or shoulder.

The addition of a dorsal strap keeps the sling against the user's body (dorsal strap model only).
